

BLOG POST:

AI in Everyday Life: Now and Later
by Andy, 21 December 2023

Hey, guys!

Today, I want to share my thoughts about Artificial Intelligence (AI), you know, the smart programme we use every day. Let's see what it is now and what's coming our way in the future.

So, AI is like our virtual friend who makes things easier. Think about your English homework or writing a message to your English friend. You just give it a prompt and you get what you need in seconds. Cool, right?

Some say that AI might drive our cars in the future. Imagine just sitting in the back, with no hands on the wheel. Awesome! But it may also replace people in other jobs. Will robots become teachers, bus drivers, and waiters? Between you and me, that's a bit scary. Will they take control of our lives? Let me know what you think.

I have heard AI could help with our health problems, too. For example, it may help fight diseases or find vaccines. That's pretty amazing! Imagine we could live longer and healthier lives. AI is like our tech companion, making life cool and easier but also a bit unpredictable (unvorhersehbar).

That's what I think about AI in everyday life. Let me know in the comments below what is your opinion on this topic.
